TITLE: Radiowave reflection from inclined meteor traces

PERIODICAL: Radiotekhnika i elektronika, v. 7, no. 4, 1962,
590 - 600

TEXT: Investigation of the scattered waves when plane e.m. waves are incident upon an ionized meteor trace at an arbitrary angle with its axis. Short wave approximation: 1) Concrete data are given for the ionized meteor traces. The formation of meteor traces is examined under conditions of diffused anisotropy which can take place at heights of 100 km or higher, under the action of the geomagnetic field: In conditions of diffused anisotropy the duration of the reflected signal depends on the vector-direction of the incident waves, the orientation of the meteor trace with respect to the lines of force of the geomagnetic field and values of the longitudinal and transverse diffusion coefficients. In the initial stages of formation of the meteor trace the scattered field outside the plane of incidence has two components: The first of these determi-

Radiowave reflection from inclined ... D230/D302

nes the Doppler frequency change independent of the lines of force of the electromagnetic field, the second has the usual exponentially-decreasing amplitude in this approximation. It follows that the character of the reflected signals in the initial stages of formation of the meteor trace and that for the formed ionized trace of large dimensions are completely different. 2) Long-wave approximation: Meteor traces with sufficiently-high linear electron concentration are examined; in this case the scattered waves are similar to those from an electrically-conducting cylinder. Analyses of scattered waves were also made separately for transverse-magnetic and transverse-electric polarizations. The full configuration of the solution was obtained by means of special e.m. potentials of axially-symmetrical plasma, for which a common equation system was found. The limiting conditions of these potentials are examined. There are 5 references: 3 Soviet-bloc and 2 non-Soviet-bloc.

Wave diffraction by slit and tape

USSR: Khar'kov elektronika vysokochastotnoye

1. Wave diffraction - plane wave diffraction by slit and tape

2. Diffraction of waves from a plane wave source by a slit and a finite slit width profile. The source is located at a distance from the slit or by an infinite depth. The slit is oriented so that the axis parallel to the tape is oriented. The source is located at a developed field (14) in the remote zone so that the field is a point-like piezoelectric in the plane of slit or tape. 3. Scattering, noise, radiation, and observation. The following formulas are used:

AF4-46-30

can be approximated by Fresnel's formula for a rectangular slot in a diff. where $\lambda = 2\pi/k$ is the wavelength and a is the width of the slot. The above asymptotic formula has a form that is similar to that of formula (ZhTF, 1958, 26, 3, p. 100) which can also be found in formula (54), developed by H. G. Kuhn, A. S. Lippmann, and G. R. Sellin. Self-sustained oscillations in a waveguide are discussed in the R8 formulas.

CITED SOURCE: Tr. uchebn. in-tov zvyazi. M-vo svyazi SSSR, vyp. 22, 1964, 13-23

TOPIC: electromagnetic wave diffraction, electromagnetic wave scattering, approximation method, scattering cross section

TRANSLATION: The author considers radiation and scattering of electromagnetic waves from surfaces and presents an analysis of the short-wave approximation under certain premises. Methods of calculating the second ^{order} of approximation are given. The results are applied to the problem of scattering by a flat surface, the differential scattering cross section, and the scattering by cylindrical surfaces.

TITLE: A remote control vacuum valve. Class 47, No. 180442

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 7, 1966, 91

TOPIC TAGS: vacuum technology, valve, remote control system

ABSTRACT: This Author Certificate presents a remote control vacuum valve containing a case, a lid, and a spring-loaded plate with a bellows connection. To simplify its construction and control and to make certain that the time of opening exceeds the time of closing, the valve is provided with a sealed opening formed by the lid, the bellows, and the plate (see Fig. 1). This opening is connected by a pipe to a distributor so that the opening is always in contact either with the compressed air or with the vacuum ducts.

A device for applying plating in a vacuum. Inventor's No. 110875

fil'ament' izotretaniy i tevar'jenniye v plate

1. Vacuum plating, plating

This Author Certificate presents a device for applying plating in a vacuum. The device (see Fig. 1) on the base 1 is mounted a central vacuum chamber 2. Several chambers and pressure vessels 3 are connected to the central vacuum chamber 2. A central vacuum pump 4 is connected to the central vacuum chamber 2. The installation is provided with a vacuum unit 5, which is connected to the central vacuum pump 4. The device is provided with a system of electromagnets 6, which increase the force needed for plating. The electromagnets 6 are connected in series in the circuit of the power source 7. The power source 7 is shown in the figure.

Khas'minskiy, R.Z., A probability approach to boundary problems for elliptic and parabolic equations. Let the equation

$$\frac{\partial u}{\partial t} = a(x,t) \frac{\partial^2 u}{\partial x^2} + b(x,t) \frac{\partial u}{\partial x} \quad (\text{Eq.1})$$

be given in a domain D bounded by the straight lines $x = 0$, $x = l$; $t = 0$, $t = T$. It is supposed that inside the domain D the coefficients a and b have three continuous derivatives with respect to both their arguments and $a(x,t) > 0$ and near the boundary $x = 0$ $b(x,t)$ and $a(x,t)$ may be unbounded and $a(x,t)$ tends to 0. The following question is studied. When is it necessary to give the boundary conditions for the first boundary problem at $x=0$. A similar question for elliptic equations has been studied in Refs. 1, 2 and 3. The condition is studied under which there is a unique solution of Eq.1

Card #11 taking given values of the boundary $x = 0$: $t = 0$

TITLE: Diffusion Processes and Elliptic Equations Degenerating at the Boundary of the Region (Diffuzionnyye protsessy i ellipticheskiye differentsial'nyye uravneniya, vyrozhdayushchiyesya na granitse oblasti)

PERIODICAL: Teoriya Veroyatnostey i Yeye Primeneniya, 1958,
Vol 3, Nr 4, pp 430 - 451 (USSR)

ABSTRACT: In Ref 1 was solved the problem of posing the first boundary value problem for a certain class of elliptic equations degenerating on the parabolic boundaries of a domain in such a way as to obtain a unique solution satisfying the boundary conditions. These investigations were continued in Refs 2 and 3 but in each of the references it was assumed that only the coefficients of the second derivatives tend to zero and that this degeneration obeys a power law. In this paper degeneration is considered without any restriction on the order of the power and other coefficients are allowed to degenerate in the sense of becoming unbounded. For simplicity of formulation only the case of two variables is considered. A probability formulation for the solution of the first boundary value

Card1/3

SOV/52-3-4-5/11

Diffusion Processes and Elliptic Equations Degenerating at the
Boundary of the Region

problem of a general linear elliptic equation without degeneration is given. Then the concepts introduced in Ref 12 of attracting and repulsing boundaries are generalised to the multi-dimensional case and effective sufficient conditions are given in terms of the coefficients of the equation for these types of boundaries. The limiting behaviour of X_t as $t \rightarrow \tau$ is studied and sufficient conditions are given for the various possibilities in the first boundary problem for Eq (2). These conditions generalise the results of Ref 1. Next, the behaviour of a process X_t is analysed in the case when the segment of the boundary is unattainable. An example is now discussed which shows that when the important condition (H) is not satisfied the trajectory X_t can have a discontinuity of the second order for $t = \tau$ with positive probability (the coefficients of the equation are said to satisfy the condition (H) if there exist closed sets

Card2/3

AUTHOR: Khas'minskiy, R.Z. SOV/52-4-3-6/10
TITLE: On Positive Solutions of the Equation $Qu + Vu = 0$
PERIODICAL: Teoriya veroyatnostey i yeye primeneniye, 1959, Vol 4, Nr 3,
pp 332-341 (USSR)

ABSTRACT: The author uses notions and notations of [Ref 1]. Let $X = (x_t, \tau, M_t, P_x, Q_t)$ be a strong Markov process with continuous trajectories in the domain D of a metric space. Let \mathcal{A} be the extended infinitesimal operator of the process X in the sense of Dynkin. Let the boundary Γ of D be reached for the first time in the moment τ . Here let $D \cup \Gamma$ be compact and $M_x \tau \leq c < \infty$ for all $x \in D$. Let the boundary Γ be regular in so far as

$$(1) \quad P_x \left\{ X_\tau \in U_{x_0} \right\} \rightarrow 1$$

holds for $x \rightarrow x_0$ for every neighborhood U_{x_0} and all $x_0 \in \Gamma$. Let $V(x)$ be a continuous, non-negative function in D . The author considers the existence of a finite mathematic expectation of

Card 1/3 the random variable $\zeta = \exp \left\{ \int_0^\tau V(X_t) dt \right\}$.

On Positive Solutions of the Equation $\mathbf{Q}u + Vu = 0$ SOV/52-4-3-6/10

Theorem 1: If $u(x) = M_x \zeta$ is finite for all $x \in D$, then it satisfies the integral equation

$$(4) \quad u(x) = M_x \int_0^x V(x_t)u(x_t)dt + 1.$$

If X is a strong Feller process, then $u(x)$ satisfies the equation

$$(2) \quad \mathbf{Q}u + V \cdot u = 0$$

with the boundary condition.

$$(5) \quad u|_{\Gamma} = 1.$$

In further theorems the author considers only strong Feller processes. It is shown that for the existence of a finite $M_x \zeta$ it is necessary and sufficient that (2) has a positive solution continuous in $D \cup \Gamma$. The author gives several conditions for the existence of such a solution. For processes described by differential equations it is shown

Card 2/3

On Positive Solutions of the Equation $\alpha u + \nu u = 0$ SOV/52-4-3-6/10

that from the existence of a positive solution of (2) in domains D_1 and D_2 being free of intersections there follows the existence of such a solution in a simply connected domain containing D_1 and D_2 . This result is used in order to prove the stability of the greatest eigenvalue of the elliptic operator $\alpha u + \nu u$ ($u|_{\Gamma} = 0$) with respect to non-local changes of domains.

The author thanks Ye.B.Dynkin for advice .

AUTHOR: Khas'minskiy, R.Z.

TITLE: Certain differential equations involved in the study of oscillations with small random perturbations

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 3, 1962, 560-563

TEXT: If one considers oscillation systems with random perturbations and if one investigates the behavior of solutions for perturbations tending to zero, then one meets differential equations which contain a small parameter ϵ on their highest derivatives. The author investigates two kinds of such differential equations.

Let $L_1(x)$ be an elliptic operator in \bar{K} , where $K = K \cup \Gamma$; $\Gamma = \Gamma_1 \cup \Gamma_2$;

$\Gamma_i = \{x : x_1 = r_i\}$. Let $L_2(x) = A(x) \frac{\partial^2}{\partial x_1^2} + B(x) \frac{\partial}{\partial x_2}$ ($A > a_0 > 0$ in K).

Let the coefficients of L_1 and L_2 be twice continuously differentiable in K , where the first derivatives are assumed to be continuous in \bar{K} . Let V and F be twice continuously differentiable complex-valued functions;

Card 1/4

Certain differential equations involved .. 3/020/62/142/003/009/027
C111/C333

Re $V(x) = V_1(x) \leq 0$; let f_i ($i = 1, 2$) be continuous and complex-valued on Γ_i . Let $\mu(x_1^0, x_2)$ denote the density of the invariant measure of the random Markov process corresponding to the operator L_2 on the circle Γ_2 .
 $x_1^0 = \{x : x_1 = x_1^0\}$. For every integrable $g(x)$ let $\tilde{g}(x_1) = \int_0^1 g(x_1, x_2) \mu(x_1, x_2) dx_2$.

Theorem 1 : The solution $u_\epsilon(x)$ of the equation

$$\left(L_1 + V + \frac{1}{\epsilon} L_2 \right) u = -F \quad (2)$$

in K which satisfies the condition

$$u_\epsilon(x_1, x_2) = f_1(x_2) \quad (1')$$

converges for $\epsilon \rightarrow 0$ to the solution $u_0(x_1)$ of the equation

Card 2/4

Card 3/4

S/020/62/142/003/009/027

Certain differential equations involved .. C111/C333

$$\tilde{L}_1(x_1) + \tilde{V}(x_1)^T u_0 = -\tilde{F}(x_1) \quad (3)$$

corresponding to the condition

$$u_0(r_i) = \frac{\int_0^1 a_{11}(r_i, x_2) \mu(r_i, x_2) f_i(x_2) dx_2}{\int_0^1 a_{11}(r_i, x_2) \mu(r_i, x_2) dx_2} = \hat{f}_i \quad (i = 1, 2). \quad (3')$$

In every closed subdomain of K it is moreover uniformly $u_\varepsilon(x) - u_0(x_1) = O(\varepsilon)$. If $f_1(x_2) = \text{const}$, then $u_\varepsilon(x) - u_0(x_1) = O(\varepsilon)$ is uniformly in K.

Now, let $L_1 = L_1(x, t)$, $V = V(x, t)$, $F = F(x, t)$ ($0 < t \leq T$) be twice differentiable in $K \times (0, T)$ with respect to all arguments.

Theorem 2 : The solution $u_\varepsilon(x, t)$ of the equation

$\frac{\partial u}{\partial t} = L_1(x, t)u + V(x, t)u + \frac{1}{\varepsilon} L_2(x)u + F(x, t)$ in $K \times (0, T)$ which satisfies the conditions $u_\varepsilon(x_1, x_2, 0) = f(x_1, x_2)$, $u_\varepsilon(r_i, x_2, t) = f_1(x_2, t)$

TITLE: Ergodic property of inhomogeneous diffusion processes

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 145, no. 5, 1962, 986-988.

TEXT: The operator $L(t,x) = \sum_{i,j=1}^N a_{ij}(t,x) \frac{\partial^2}{\partial x_i \partial x_j} + \sum_{i=1}^N b_i(t,x) \frac{\partial}{\partial x_i}$

is considered under the assumption that the following conditions are

fulfilled: $\sum_{i,j=1}^N a_{ij}(t,x) \xi_i \xi_j \geq \gamma(x) \sum_{i=1}^N \xi_i^2; |a_{ij}(t,x)| \leq M(r^2 + 1),$ $|b_i(t,x)| \leq M(r + 1)$, $r^2 = |x|^2$. The operator $L(t,x)$ is connected with a Markovian process $X(t,\omega)$ whose density $p(s,x,t,y)$ of the transition probability can be regarded as Green's function of the equations $\partial u/\partial s + L(s,x)u = 0$, $\partial u/\partial t = L^*(t,y)u$. It is demonstrated that the limit $\lim_{s \rightarrow -\infty} p(s,x,t,y) = p(t,y) > 0$ exists if the coefficients of L satisfy the

Card 1/2

Ergodic property of inhomogeneous ...

S/020/62/145/005/003/020
B112/B104

condition $\sum_{i=1}^N [a_{ii}(t,x) + b_i(t,x)x_i] < -\delta < 0$ for $r > r_1$. The solution $u(t,y)$ of Cauchy's problem $\partial u / \partial t = L^*(t,y)u$, $u(s,y) = u_0(y)$ ($t > s$) is shown to have the following properties if $p(s,x,s+1,y) < M$: $u(t,y) - p(t,y) \int_{E_N} u_0(y) dy$ tends to zero uniformly in each compact subspace $K \subset E_N$ for $t \rightarrow \infty$ if $\int_{E_N} |u_0(y)| dy$ converges.

$\int_{E_N} u_0(y) dy =$ implies $u(t,y) \rightarrow \infty$ for $t \rightarrow \infty$.

TITLE: Principle of averaging for parabolic and elliptic differential equations and for Markov processes with small diffusion

PERIODICAL: Teoriya veroyatnostey i yeye primeneniya, v. 8, no. 1, 1963,
3 - 25

TEXT: N. N. Bogolyubov (O nekotorykh statisticheskikh metodakh v matematicheskoy fizike - Certain statistical methods in mathematical physics. Izd-vo AN USSR, 1945) formulated the following general principle of averaging: the solution $y(t)$ of the equation $dy/dt = \epsilon X_0(y)$, where

$$X_0(x) = \lim_{T \rightarrow \infty} \frac{1}{T} \int_0^T X(t, x) dt,$$

approximates the solution $x(t)$ of the equation $dx/dt = \epsilon X(t, x)$ with arbitrary accuracy when $\epsilon \rightarrow 0$. In the present paper this principle is applied to parabolic equations. The theorem of the convergence of an invariant measure of a Markov process on a torus to an invariant measure of the flow

AUTHOR: Khas'minskij, R. Z. (Moscow)

TITLE: Performance of an auto-oscillating system under the effect of small noise²¹

SOURCE: Prikladnaya matematika i mehanika, v. 27, no. 4, 1963, 683-688

TOPIC TAGS: white noise, Markov process, stationary distribution, principle of averaging, oscillating system

ABSTRACT: The author considers the performance of the auto-oscillating system governed by $X'' + \omega^2 X - \varepsilon f(X, X') = \mu \xi'(t)$ (0.1) for small ε and μ , where $\xi'(t)$ is a white noise process. He studies the Markov process $(X(t), X'(t))$ determined by (0.1) for various assumptions on the order of the variable $\mu/\sqrt{\varepsilon}$. He studies the behavior of the transition probability density of this process in his second section and its stationary distribution in his third section. In particular he shows that if $\mu/\sqrt{\varepsilon} \ll 1$ the white noise can be neglected when considering the stationary behavior of auto-oscillations. Basic attention is paid to the case $\mu/\sqrt{\varepsilon} \sim 1$ in which case it is shown that the stationary probability distribution has a limit as $\varepsilon \rightarrow 0$. This limit is found. In his fourth section he computes the

Card 1/2

L 18092-63
ACCESSION NR: AP3004114

effective frequency of the oscillations with accuracy up to $o(\varepsilon)$. The results are then applied to the Van Der Pohl case, where the stationary distribution turns out to be Gaussian. He notes that the methods developed are suitable for studying the effect of random noise on much more general systems, even in higher dimensions which are conservative for the small parameter $\varepsilon = 0$. TITLE: On stability of systems under steadily acting random disturbances

SOURCE: AN SSSR. Institut problem peredachi informatsii. Opoznamye obrazov. Teoriya peredachi informatsii [Master's dissertation]. Theory of information transmission). Moscow, Izd-vo Nauka, 1985, 72-85

dynamic system stability, asymptotic stability, Lyapunov stability, A stability

16, 40, -5

ABSTRACT: Stability of a dynamic system described by the following differential equation in vector form:

$$\frac{dx}{dt} = F(x, t) \text{ where } x = (x_1, \dots, x_n); F = (F_1, \dots, F_n), \quad (1)$$

under steadily acting random disturbances of the "white noise" type is analyzed with the assumptions that the origin of coordinates is the state of equilibrium (that is, $F(0, t) = 0$) and the functions

L 17004-66

ACC NR: AT6004690

F₁, ..., F_n are continuous with respect to their arguments and satisfy the Lipschitz condition. The reasons why the ordinary concept of stability is not sufficient and new concepts of stability which are introduced are explained. Three definitions of the stability (A-stability) of system (1) at x = 0 are formulated: 1) local weak A-stability; 2) globally weak A-stability; and 3) locally strong A-stability; some properties of such A-stable systems are analyzed. Criteria are proved to establish sufficient conditions for system (1) to be stable in the defined sense. Since fulfillment of derived stability criteria are difficult to verify in many cases, A-stability criteria in terms of Lyapunov's function are obtained and proved. It is shown that asymptotic stability of system (1) is not a sufficient condition for that system to be weakly A-stable. When system (1) is stable, asymptotic stability is a sufficient condition for that system to be weakly A-stable. Orig. art. has 4 formulas. (LK)

The degree of dissipation of random processes defined by differential equations

Problemy peredachi informatsii, v. 1 no. 1 (se - 48-194)

TAGS: random process, differential equation, probability, Euclidean space

In [1] the author studies several properties of $\mathbb{D} \subset \mathcal{C}$ of random processes $X(t, \omega)$, which solutions to the equation in the n-dimensional Euclidean space [6]

$$\frac{dx}{dt} = F(x, t) + \xi(t, \omega). \quad (1)$$

If $x(t, \omega)$ is an n-dimensional random process, equations of this type occur, for example, in investigations of the reaction of a nonlinear system to a random input signal. In particular, without any general assumptions about the coefficients in the right side of eq. (1), it follows the following properties of eq. (1) [1]:

Card 1/3

UDC: 519.27

L 23982-66

AC/NR: AP6004988

the degree of dissipation of the process $X(t, \omega)$, i.e., the right uniformly probability of the random quantities $X(t, \omega)$, where end here, $|x| = |x_1|^{\alpha_1} + \dots + |x_n|^{\alpha_n}$.

2. the existence of a stationary, as well as of a periodic solution of the system (0.1) in which x is distinctly independent or depends periodically on t , and also the corresponding process $X(t, \omega)$. The condition of the existence of a stationary solution of the system (0.1) is the system

$$\frac{dx}{dt} = F(x, t) \quad (0.2)$$

where small

$$|X(t_0)| + \sup_{t > t_0} \{ \sup_{\omega} M |\xi(t, \omega)| \}.$$

The conditions for the fulfillment of the properties studied are formulated in terms of the Lyapunov function. Some results are presented below.

$$\frac{dx}{dt} = G(x, t, \xi(t, \omega)). \quad (0.3)$$

ABSTRACT: The stability of a linear system with random perturbations of its parameters

PUBLISHER: Prikladnaya matematika i mehanika, v. 30, no. 2, 1966, 404-409

KEY WORDS: Linear system, linear differential equation, mathematical determinant, stochastic process, perturbation, white noise.

ABSTRACT: The problem of the stability of a system that is described by an equation of the n-th order with random coefficients is considered. Necessary and sufficient conditions of mean square asymptotic stability, which convert to the Routh-Hurwitz criterion in the absence of noise, are obtained. A determinant system described by a homogeneous differential equation of order n with constant coefficients

$$y^{(n)} + a_1 y^{(n-1)} + \dots + a_n y = 0$$

is examined. In the presence of "white noise" type random forces, it converts to a stochastic differential equation

$$y^{(n)} + [a_1 + \eta_1(t)] y^{(n-1)} + \dots + [a_n + \eta_n(t)] y = 0.$$

Necessary and sufficient conditions for the system written in the form

SOURCE: Problemy peredachi informatsii, v. 1, no. 3, 1965, 113-117

TOPIC TAGS: random noise signal, recognition process, optimization, analog computer, digital computer

ABSTRACT: In this note, the author investigates the operations of an optimizing device with a random noise, assuming that the introduction of noise into a system does not require much time. Apparently, this is the case with the introduction of noise into analog devices, and the opposite holds true with the introduction of a random process into a digital computer, which requires a long interval of time due to the simulation of this process, which makes the application of the algorithm presented in the note inefficient. The main principle of the method proposed is explained schematically. The present article investigates the behavior of the solution of the equation

$$\frac{dx}{dt} = \text{grad } f(x) + \sigma \xi(t), \quad (1)$$

where $\xi(t) = (\xi_1(t), \dots, \xi_n(t))$ is the generalized random process of "white noise" of power n , i.e., a process the integral of which $\xi(t) - \xi(0)$ is equal to the increment of the n -dimensional Wiener random process, so that $M[\xi(t) - \xi(0)] = 0; D[\xi_i(t) - \xi_i(0)] = t$ ($i = 1, \dots, n$). TITLE: Certain limiting theorems for solving differential equations with a random right-hand side

SOURCE: AN SSSR. Doklady, v. 168, no. 4, 1966, 755-758

TOPIC TAGS: differential equation solution, random process, Euclidean space

ABSTRACT: In many physical and, in particular, radio engineering problems it is of interest to study random processes which are solutions of differential equations, the right-hand member of which includes an event. In this case, it is often possible to distinguish in the right-side of the equation a small parameter ϵ which can characterize the smallness of the random action, its "correlation time". The asymptotic behavior of such random processes when $\epsilon \rightarrow 0$ is examined in this article. It is assumed that $F(x, t, \omega, \epsilon)$ is a function with values of an 1-dimensional Euclidean space E^1 determined for $x \in E^1, t \geq 0, \omega \in \Omega, \epsilon \geq 0$; here Ω is a space of elementary events, for the σ -algebra of measurable sets of which

Cora 1/2

UDC: 519.27+517.91

L 43726-66

ACC NR: AP6019523

the probability measure P is prescribed. It is assumed that $F(x, t, \omega, \epsilon)$ at fixed x, ϵ is a random process measurable with respect to t, ω and satisfies the Lipschitz condition

$$|F(x_2, t, \omega, \epsilon) - F(x_1, t, \omega, \epsilon)| < L|x_2 - x_1| \quad (1)$$

and for all $t > 0$ the condition

$$P\left\{\int_0^t |F(0, s, \omega)| ds < \infty\right\} = 1. \quad (2)$$

When these requirements are met, the problem

$$dx/dt = eF(x, t, \omega, \epsilon); \quad x(0) = x_0, \quad (3)$$

has a random process $x_\epsilon(t, \omega)$ continuous with probability 1 as a unique solution. The paper was presented by Academician Kolmogorov, A. N., 14 Sep 65. Orig. art. has: 11 formulas.

TITLE: On random processes determined by differential equations with a small parameter

SOURCE: Teoriya veroyatnostoy i yeye primeneniya, v. 11, no. 2, 1966, 240-259

TOPIC TAGS: differential equation, Markov process, random process, stochastic process, probability, mathematic space, Gaussian distribution, Green function, Fourier series

ABSTRACT: The author studies the behavior (when $\epsilon \rightarrow 0$ over a time segment on the order of $O(1/\epsilon)$) of the trajectory of a random process which can be determined by the differential equation

$$\frac{dx}{dt} = \epsilon F(x, t, \omega); \quad x(0) = x_0,$$

where $(\Omega = \{\omega\}, \mathcal{U}, P)$ is the probability space. If the function F satisfies the conditions

$$|F(x_2, t, \omega) - F(x_1, t, \omega)| < L|x_2 - x_1|$$

and

$$P \left\{ \int_0^t |F(0, s, \omega)| ds < \infty \right\} = 1,$$

Card 1/4

06219-67

ACC NR: AP6028425

and if

$$\sup_{t_0 > 0} M \left| \frac{1}{T} \int_{t_0}^{t_0 + T} F(x, t, \omega) dt - F(x) \right| \rightarrow 0 \quad (T \rightarrow \infty)$$

is satisfied for processes $F(x, t, \omega)$, then the solution $X_\varepsilon(\tau, \omega)$ of the problem

$$\frac{dx}{d\tau} = F(x, \tau/\varepsilon, \omega); \quad x_\varepsilon(0) = x_0$$

converges when $\varepsilon \rightarrow 0$ on the solution $x^0(\tau)$ of the problem

$$\frac{dx^0}{d\tau} = F(x^0); \quad x^0(0) = x_0$$

uniformly for $0 \leq \tau \leq \tau_0$, i.e., when $\varepsilon \rightarrow 0$

$$\sup_{0 \leq \tau \leq \tau_0} M |X_\varepsilon(\tau, \omega) - x^0(\tau)| \rightarrow 0.$$

The set of functions $F(x, t, \omega) = (F_1(x, t, \omega), \dots, F_l(x, t, \omega))$ satisfies the conditions

$$M |F(0, t, \omega)|^{1+\delta} < N; \quad \left| \frac{\partial F_i}{\partial x_j}(x, t, \omega) \right| < N; \quad \left| \frac{\partial^2 F_i}{\partial x_j \partial x_k}(x, t, \omega) \right| < N; \\ (i, j, k = 1, \dots, l; \delta > 0);$$

if uniformly over $x, t_0 > 0$, there exist the limits

$$\lim_{T \rightarrow \infty} \frac{1}{T} \int_{t_0}^{t_0 + T} M F(x, t, \omega) dt = F(x),$$

Card 2/4

L 06219-67

ACC NR: AP6028425

$$\lim_{T \rightarrow \infty} \frac{1}{T} \int_0^{t+\tau} \int_0^{t+\tau} ds dt M [F_k(x, s, \omega) - MF_k(x, s, \omega)] X$$

$$\times [F_k(x, t, \omega) - MF_k(x, t, \omega)] = A_M(x);$$

the set \mathfrak{M}_k of σ -algebras of the sets of \mathfrak{A} satisfies the conditions: $\mathfrak{M}_k \subset \mathfrak{A}$ for all s, t ; $\mathfrak{M}_k \subset \mathfrak{A}_k$ if $s_1 \leq s$ and $t \leq t_1$; and the set \mathfrak{M}_k satisfies the condition of strong intermixing; and for all $\tau (0 \leq \tau \leq \tau_0)$

$$\left| \int_0^\tau [MF(x^0(s), s/\epsilon, \omega) - F(x^0(s))] ds \right| \leq c\epsilon,$$

$$\left| \int_0^\tau \left[M \frac{\partial F_k}{\partial x_j}(x^0(s), s/\epsilon, \omega) - \frac{\partial F_k}{\partial x_j}(x^0(s)) \right] ds \right| \leq c\epsilon,$$

Then the process

$$Y^{(\epsilon)}(\tau, \omega) = \frac{X^{(\epsilon)}(\tau, \omega) - x^0(\tau)}{\sqrt{\epsilon}}$$

when $\epsilon \rightarrow 0$ converges weakly over the interval $[0, \tau_0]$ to a Gaussian Markov process $Y^{(0)}(\tau, \omega)$, which satisfies the system of linear equations

$$Y^{(0)}(\tau) = W^{(0)}(\tau) + \int_0^\tau \frac{\partial F}{\partial x}(x^0(s)) Y^{(0)}(s) ds,$$

TITLE: On the stability of stochastic systems

SOURCE: Problemy peredachi informatsii, v. 2, no. 3, 1966, 76-91

TOPIC TAGS: stochastic process, white noise, Markov process, asymptotic property, probability, linear system, mathematic matrix

ABSTRACT: This paper presents an investigation of signal properties at the output of a system whose parameters are subjected to random fluctuations of the "white noise" type. The conditions for p-stability are studied. The linear stochastic system

$$dX_i = \sum_{j=1}^n b_{ij}(t) X_j dt + \sum_{k,j=1}^n \sigma_{ij}^{(k)}(t) X_k d\beta_k(t)$$

is examined. Here $b_{ij}(t)$ and $\sigma_{ij}^{(k)}(t)$ are continuous and bounded at $t \geq t_0$ functions of time. It is shown that, with the exception of critical cases, the stability of the above output process $X(t)$ is determined by the stability of the linearized system (first approximation). Necessary and sufficient conditions for p-stability of stochastic systems are derived. It is shown that the p-stability of process $X(t)$ for any $p > 0$ assures stability in the presence of continuously acting disturbances. The process at the output of the system is found to be dissipative when the input signal has a finite mathematical expectation and the system itself is stable. Orig. art. has: 51 formulas.

ABSTRACT:

Boilers of a "TETs" were designed for operation on pulverized coal fuel. The change conversion to gas required a modification of the system of combustion control and a "fuel-air" control system was adopted (see diagram). Since new controllers were not available, the existing "KRZM" type controllers of the Venyukovskiy Plant were rebuilt and transformed into "KIM" gas supply controllers. Tests carried out with these rebuilt controllers showed that their quality was better than plant controllers. Standard "KRV-O" and "KRR-O" type columns were used as controllers for the exhaust. Because of great fluctuations in gas pressure in the gas collector, a "KRTA-O" controller was rebuilt and transformed into the "KRD" type gas pressure controller which is utilized for the whole boiler-installation. The accuracy of control of the gas pressure attains ± 0.03 kg per sq cm. The gas pipelines of each boiler contain flap valves, which are connected by cable with the
